Rode and Crotty

Critical Reflection:

For both of my AI prompts, I asked them to give me a list of code, but then to also explain each step so that I could understand what everything was doing. This was really helpful because I would never be able to understand what I am copying and pasting into my style CSS folder, but AI was really helpful to go through each step. For the carousel, it created two different sections of code, one to paste into the index to input the images from my image folder, and one section of code to paste into my CSS folder that controls the left and right buttons as well as the height and width of each of my images in the carousel. There were many issues with this, so I took the opportunity to use Experiment C to fix this code that I had pasted that ended up not working. I had to go through and fix the size of my carousel to fit my images, which was simple because AI gave me code to paste at the bottom of my style CSS file rather than replacing anything inside of it. I also needed to fix the second image of my carousel because it would only show up on the preview option on VSC, but not on my Github pages. I asked AI to tell me what to do and it had me test whether it was the image itself of the carousel in general, and the test showed that it was the image, so I just had to replace it with a different one.

AI was extremely helpful in creating code to copy and paste into my index and CSS file. It was also helpful when instructed to explain each section of code step by step so that I knew exactly what was happening rather than going in blind and potentially messing up my index. AI was problematic when trying to fix the height of my carousel. It never knew exactly what to do

because it couldn't see what it looked like. I needed to input a screenshot of what it looked like for it to tell me what to do exactly to fix it, and only then is when it worked. My role in this, even though it's very easy to just copy and paste, is to make it human through getting the explanations for each section of code as well as the comments with my understanding of everything.

I believe that using AI to help code helps my development as a programmer because it introduces me to new code that I never knew I could do beforehand. Without the guidance of AI, it would have taken me so long to develop code that actually works the way I wanted it to or to fix code that I had accidentally broken. I think proper citation of code should state that AI assisted in creating the code. It is dishonest to claim this work as my own because I didn't create it completely. I think in both academic and professional moments, AI should be mentioned if it assisted, whether you cite it after each part of code or at the end. For me, I have decided that using AI is extremely helpful, however it cannot take over everything. I need to still learn how to use it and be able to explain what it is doing without its help. I will use AI when I need help fixing code that I cannot do on my own, or helping to create new code that I wouldn't know how to do on my own. I will not use it to do all of my work, or to just copy and paste without explaining what everything means and what it does.

AI Prompts and code:

All AI prompts and code/visualizations are in Lab 5 page.

AI Output before modifications:

Gave me a whole list of code to create a new index page and Style CSS, I had to explain that I already had a repository with an index page and style CSS, and then it gave me code that I can copy and paste into my index and CSS
